

PATENT COOPERATION TREATY

PCT

NOTIFICATION OF ELECTION

(PCT Rule 61.2)

From the INTERNATIONAL BUREAU

To:

United States Patent and Trademark
Office
(Box PCT)
Crystal Plaza 2
Washington, DC 20231
ETATS-UNIS D'AMERIQUE

in its capacity as elected Office

Date of mailing (day/month/year)

02 April 1997 (02.04.97)

International application No.

PCT/GB96/01996

Applicant's or agent's file reference

AF/P5148WO

International filing date (day/month/year)

15 August 1996 (15.08.96)

Priority date (day/month/year)

16 August 1995 (16.08.95)

Applicant

PHELAN, Sean

1. The designated Office is hereby notified of its election made:

in the demand filed with the International Preliminary Examining Authority on:

12 March 1997 (12.03.97)

in a notice effecting later election filed with the International Bureau on:

2. The election ☒ was

was not

made before the expiration of 19 months from the priority date or, where Rule 32 applies, within the time limit under Rule 32.2(b).

The International Bureau of WIPO
34, chemin des Colombettes
1211 Geneva 20, Switzerland

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(PCT Article 36 and Rule 70)

Applicant's or agent's file reference AF/P5148WO	FOR FURTHER ACTION See Notification of Transmittal of International Preliminary Examination Report (Form PCT/IPEA/416)	
International application No. PCT/GB 96/ 01996	International filing date (day/month/year) 15/08/1996	Priority date (day/month/year) 16/08/1995
International Patent Classification (IPC) or national classification and IPC G06F17/30		
Applicant PHELAN, Sean		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

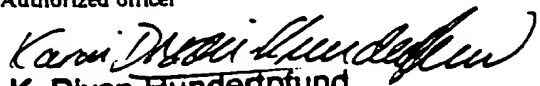

2. This REPORT consists of a total of 8 sheets, including this cover sheet.

☐ This report is also accompanied by ANNEXES, i.e., sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consists of a total of _____ sheets.

3. This report contains indications and corresponding pages relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☐ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☒ Certain defects in the international application
- VIII ☒ Certain observations on the international application

Date of submission of the demand 12/03/1997	Date of completion of this report 13. 11. 97
Name and mailing address of the IPEA:  European Patent Office D-80298 Munich Tel. (+49-89) 2399-0, Tx: 523656 epmu d Fax: (+49-89) 2399-4465	Authorized officer  K. Dixon-Hundertpfund Telephone No.

I. Basis of the report

1. This report has been drawn up on the basis of (Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.):

☒ the international application as originally filed.

☐ the description, pages _____, as originally filed,
pages _____, filed with the demand,
pages _____, filed with the letter of _____,
pages _____, filed with the letter of _____.

☐ the claims, Nos. _____, as originally filed,
Nos. _____, as amended under Article 19,
Nos. _____, filed with the demand,
Nos. _____, filed with the letter of _____,
Nos. _____, filed with the letter of _____.

☐ the drawings, sheets/fig _____, as originally filed,
sheets/fig _____, filed with the demand,
sheets/fig _____, filed with the letter of _____,
sheets/fig _____, filed with the letter of _____.

2. The amendments have resulted in the cancellation of:

☐ the description, pages _____.
☐ the claims, Nos. _____.
☐ the drawings, sheets/fig _____.

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

Intern. application No.

PCT/GB96/01996

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step and industrial applicability; citations and explanations supporting such statement

1. STATEMENT

Novelty (N)	Claims 1-27 (yes) _____	YES
	Claims _____	NO
Inventive Step (IS)	Claims 1-27 (yes) _____	YES
	Claims _____	NO
Industrial Applicability (IA)	Claims 1-27 (yes) _____	YES
	Claims _____	NO

2. CITATIONS AND EXPLANATIONS

1. The subject-matter of Claims 1 and 17 is new and inventive and therefore satisfies the requirements of Articles 33(2) and (3) PCT.
2. The following documents cited in the International Search Report are also cited in this preliminary report:

D1: 1994 VEHICLE NAVIGATION AND INFORMATION SYSTEMS CONFERENCE PROCEEDINGS (CAT. NO. 94CH35703), PROCEEDINGS OF VNIS'94 - 1994 VEHICLE AND NAVIGATION AND INFORMATION SYSTEMS CONFERENCE, YOKOMAHA, JAPAN, 31 AUG.-2 SEPT. 1994, ISBN 0-7803-2105-7, 1994, NEW YORK, NY, USA, IEEE, USA, pages 591-596, XP000612712, ARIKAWA M: "Personal dynamic maps based on distributed geographic information servers"

D2: DATABASE, APRIL-MAY 1995, USA, vol. 18, no. 2, ISSN 0162-4105, pages 65-67, XP000612268, DAVIS P: "An interactive hypermedia map viewer (the Xerox PARC map server)"

D3: EP-A-0 239 143 (PIONEER ELECTRONIC CORP)

D4: EP-A-0 379 198 (SHARP KK)

- 3.1 D2 describes the Xerox Map Server, whose home page provides the user with a simplified view of the globe. The user need only point and click on part of the map to send a request to the server for more detailed information. This is accomplished by transmitting the user's cursor coordinates, which correspond to a predefined location in the map database to the map server, which returns the desired location as an in-line image. The resulting map can be selected again for a more detailed view. IN Xerox Map Server, other options allow the user to display political borders, rivers, glaciers and other geographical landmarks. Every map the user can possibly render has its own Uniform Resource Locator.

Therefore, D2 teaches a method as defined in claim 1, page 17, lines 1-11 and 17-24 and corresponding computer system as defined in claim 17, page 20, lines 12-17 and 23-31.

- 3.2 The problem is to enable a user to see information data relating to a particular place of interest to him or her within the image of the geographical area on the visual display unit.

- 3.3 This is resolved as defined in claims 1 and 17 by:

- means for/ storing on an information server computer information data relating to at least one place of interest within the geographical area, said information data including data representative of the spatial coordinates of the place of interest within the area,

- means for/ transmitting an information request to the information server computer from the client computer,

and transmitting from the information server computer to the client computer in response to the information request the information data relating to at least one place of interest within the geographical area, and

- means for/ displaying the information data relating to the at least one place of interest on the visual display unit.

- 3.4 This is not known from any available prior art document nor combination thereof.
4. Dependent claims 2 to 16 and 18 to 27, which are dependent on claims 1 and 17 respectively, satisfy the requirements of Articles 33(2) and (3) PCT.
5. For claims 28 and 29, see paragraph VIII, 2.

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

1.1 D1 discloses how to build a dynamic map from information derived from several geographic databases, which store geographic data as conceptual objects. To create a dynamic map from the geographic databases, the conceptual objects of users interest are retrieved by queries from the geographic databases. Visualisation methods are then used to determine which display objects relating to the conceptual objects should actually be displayed on a user's visual display unit to provide the visual layers. The dynamic map is built up by combining the visual layers relating to several geographic data bases.

D3 discloses a map navigation system, in which a map matching between current position data obtained measuring a current position of a movable body using for example GPS and map data stored beforehand is carried out, and the current position of the movable body is displayed on a displayed map. The navigation system includes a first storage device for storing position data indicating positions of facilities, facility type data indicating types of the facilities, and guide marks denoting the facilities and a second storage device for storing display type data indicating the types of facilities to be displayed on the displayed map.

D4 discloses a navigation system comprising:

- a GPS receiver mounted on a vehicle for determining the position data including longitude and latitude data of the vehicle,
- a unit mounted on the vehicle to transmit data representing the determined position data and an ID code to a key station via a communication system,

- a database unit mounted in the key station for storing map data,
- a unit in the key station responsive to the received position data for deriving map data of an area including the position of the vehicle from the data base unit, and for transmitting the data in connection with the derived map data and the ID code to the vehicle,
- a unit in the vehicle responsive to the data transmitted from the key station for displaying a composite image as a visual presentation of the data composed of the position data and the map data.

1.2 The documents D1, D2, D3 and D4 have not been identified in the description nor as the relevant background art disclosed therein been discussed. The requirements of Rule 5.1(a)(ii) PCT are, thus, not fulfilled.

2. The independent Claims 1 and 17 have not been properly cast out in the two-part form, with those features which in combination are part of the prior art being placed into the preamble. They, therefore, do not meet the requirements of Rule 6.3(b) PCT.

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

1. In independent claims 1 and 17, it is not clear what information the map request and the information request include, so that these claims do not satisfy article 6 PCT. From the description, (see page 9, lines 16-18), it seems that the map request and the information request contain coordinate data which specify the request's geographical area.
2. Claims 28 and 29 were not examined as the matter for which protection is sought is completely unclear, Article 6 PCT, because no technical features of the computer system and method are defined in said claims, these claims merely referring to the description and drawings.
3. Dependent method claims 6, 8-10 and 13-16 do not satisfy Article 6 PCT because they define "apparatus" features and not "steps" features as is usual in method claims.

D3: EP-A-0 239 143 (PIONEER ELECTRONIC CORP)

D4: EP-A-0 379 198 (SHARP KK)

- 3.1 D2 describes the Xerox Map Server, whose home page provides the user with a simplified view of the globe. The user need only point and click on part of the map to send a request to the server for more detailed information. This is accomplished by transmitting the user's cursor coordinates, which correspond to a predefined location in the map database to the map server, which returns the desired location as an in-line image. The resulting map can be selected again for a more detailed view. IN Xerox Map Server, other options allow the user to display political borders, rivers, glaciers and other geographical landmarks. Every map the user can possibly render has its own Uniform Resource Locator.

Therefore, D2 teaches a method as defined in claim 1, page 17, lines 1-11 and 17-24 and corresponding computer system as defined in claim 17, page 20, lines 12-17 and 23-31.

- 3.2 The problem is to enable a user to see information data relating to a particular place of interest to him or her within the image of the geographical area on the visual display unit.

- 3.3 This is resolved as defined in claims 1 and 17 by:

- means for/ storing on an information server computer information data relating to at least one place of interest within the geographical area, said information data including data representative of the spatial coordinates of the place of interest within the area,
- means for/ transmitting an information request to the information server computer from the client computer,

and transmitting from the information server computer to the client computer in response to the information request the information data relating to at least one place of interest within the geographical area, and

- means for/ displaying the information data relating to the at least one place of interest on the visual display unit.

- 3.4 This is not known from any available prior art document nor combination thereof.
4. Dependent claims 2 to 16 and 18 to 27, which are dependent on claims 1 and 17 respectively, satisfy the requirements of Articles 33(2) and (3) PCT.
5. For claims 28 and 29, see paragraph VIII, 2.

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

1.1 D1 discloses how to build a dynamic map from information derived from several geographic databases, which store geographic data as conceptual objects. To create a dynamic map from the geographic databases, the conceptual objects of users interest are retrieved by queries from the geographic databases. Visualisation methods are then used to determine which display objects relating to the conceptual objects should actually be displayed on a user's visual display unit to provide the visual layers. The dynamic map is built up by combining the visual layers relating to several geographic data bases.

D3 discloses a map navigation system, in which a map matching between current position data obtained measuring a current position of a movable body using for example GPS and map data stored beforehand is carried out, and the current position of the movable body is displayed on a displayed map. The navigation system includes a first storage device for storing position data indicating positions of facilities, facility type data indicating types of the facilities, and guide marks denoting the facilities and a second storage device for storing display type data indicating the types of facilities to be displayed on the displayed map.

D4 discloses a navigation system comprising:

- a GPS receiver mounted on a vehicle for determining the position data including longitude and latitude data of the vehicle,
- a unit mounted on the vehicle to transmit data representing the determined position data and an ID code to a key station via a communication system,

- a database unit mounted in the key station for storing map data,
- a unit in the key station responsive to the received position data for deriving map data of an area including the position of the vehicle from the data base unit, and for transmitting the data in connection with the derived map data and the ID code to the vehicle,
- a unit in the vehicle responsive to the data transmitted from the key station for displaying a composite image as a visual presentation of the data composed of the position data and the map data.

- 1.2 The documents D1, D2, D3 and D4 have not been identified in the description nor as the relevant background art disclosed therein been discussed. The requirements of Rule 5.1(a)(ii) PCT are, thus, not fulfilled.
2. The independent Claims 1 and 17 have not been properly cast out in the two-part form, with those features which in combination are part of the prior art being placed into the preamble. They, therefore, do not meet the requirements of Rule 6.3(b) PCT.

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

1. In independent claims 1 and 17, it is not clear what information the map request and the information request include, so that these claims do not satisfy article 6 PCT. From the description, (see page 9, lines 16-18), it seems that the map request and the information request contain coordinate data which specify the request's geographical area.
2. Claims 28 and 29 were not examined as the matter for which protection is sought is completely unclear, Article 6 PCT, because no technical features of the computer system and method are defined in said claims, these claims merely referring to the description and drawings.
3. Dependent method claims 6, 8-10 and 13-16 do not satisfy Article 6 PCT because they define "apparatus" features and not "steps" features as is usual in method claims.

Box No. VII INTERNATIONAL SEARCHING AUTHORITY

Choice of International Searching Authority (ISA) (If two or more International Searching Authorities are competent to carry out the international search, indicate the Authority chosen; the two-letter code may be used): ISA /

Earlier search Fill in where a search (international, international-type or other) by the International Searching Authority has already been carried out or requested and the Authority is now requested to base the international search, to the extent possible, on the results of that earlier search. Identify such search or request either by reference to the relevant application (or the translation thereof) or by reference to the search request.

Country (or regional Office): _____ Date (day/month/year): _____ Number: _____

Box No. VIII CHECK LIST

This international application contains the following number of sheets:

1. request : 3 sheets
2. description : 16 sheets
3. claims : 7 sheets
4. abstract : 1 sheets
5. drawings : 2 sheets

Total : 29 sheets

This international application is accompanied by the item(s) marked below:

1. ☐ separate signed power of attorney
2. ☐ copy of general power of attorney
3. ☐ statement explaining lack of signature
4. ☒ priority document(s) identified in Box No. VI as item(s): (1)
5. ☐ fee calculation sheet
6. ☐ separate indications concerning deposited microorganisms
7. ☐ nucleotide and/or amino acid sequence listing (diskette)
8. ☐ other (specify):

Figure No. 2 of the drawings (if any) should accompany the abstract when it is published.

Box No. IX SIGNATURE OF APPLICANT OR AGENT

Next to each signature, indicate the name of the person signing and the capacity in which the person signs (if such capacity is not obvious from reading the request).

For the applicant:

FLINT, Adam
W. H. Beck, Greener & Co.

For receiving Office use only

1. Date of actual receipt of the purported international application:

3. Corrected date of actual receipt due to later but timely received papers or drawings completing the purported international application:

4. Date of timely receipt of the required corrections under PCT Article 11(2):

5. International Searching Authority specified by the applicant: ISA /

6. ☐ Transmittal of search copy delayed until search fee is paid

2. Drawings:

☐ received:

☐ not received:

For International Bureau use only

Date of receipt of the record copy by the International Bureau:

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference AF/P5148WO	FOR FURTHER ACTION see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. PCT/GB 96/ 01996	International filing date(<i>day/month/year</i>) 15/08/1996	(Earliest) Priority Date (<i>day/month/year</i>) 16/08/1995
Applicant PHELAN, Sean		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

1. ☐ Certain claims were found unsearchable (see Box I).

2. ☐ Unity of invention is lacking (see Box II).

3. ☐ The international application contains disclosure of a nucleotide and/or amino acid sequence listing and the international search was carried out on the basis of the sequence listing

☐ filed with the international application.

☐ furnished by the applicant separately from the international application,

☐ but not accompanied by a statement to the effect that it did not include matter going beyond the disclosure in the international application as filed.

☐ Transcribed by this Authority

4. With regard to the title, ☒ the text is approved as submitted by the applicant.

☐ the text has been established by this Authority to read as follows:

5. With regard to the abstract,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this International Search Report, submit comments to this Authority.

6. The figure of the drawings to be published with the abstract is:

Figure No. 2 ☒ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

☐ None of the figures.

(54) Title: COMPUTER SYSTEM FOR IDENTIFYING LOCAL RESOURCES**(57) Abstract**

A map of the area of a client computer (10) is requested from a map server (11). Information relating to a place of interest is requested from an information server (12) by the client computer (10). The information is superimposed or overlaid on a map image at a position on the map image corresponding to the location of the place of interest on the map. The information (or "overlay") server (12) may contain details of, for example, hotels, restaurants, shops or the like, associated with the geographical coordinates of each location. The map server (11) contains map data, including coordinate data representing the spatial coordinates of at least one point on the area represented by the map.

-1-

COMPUTER SYSTEM FOR IDENTIFYING LOCAL RESOURCES

This invention relates to computer systems, and to methods of operating computer systems. The invention has particular relevance to the so called "World Wide Web", which is part of the global computer network system known as the Internet.

The Internet and the World Wide Web ("WWW" or "The Web") have been described in great detail in a large number of publications in recent months. The Web consists essentially of an enormous number (at the last count, many millions, and expanding rapidly) of "host" or "server" computers which contain information of various types which users may wish to access. Users of the system employ a "client" computer, running "client" software, in order to access the information. Such client programs are usually known as "browsers".

Various standard protocols enable requests to be formulated by the many client computers, and passed via the Internet to whichever computer holds the relevant information, which then returns the information to the client, using the same protocols.

The protocol which is used on the World Wide Web is an agreed standard, known as the HyperText Transfer Protocol (HTTP).

The language in which "Web" pages are generated is known as "HyperText Markup Language" (HTML).

The success of HTML/HTTP is based to a large extent on the ability of HTTP to produce so called "hypertext links" in the form of some sort of displayable icon on the computer screen of the client. The icon may be a graphical icon, or, more commonly, simply text represented in a form which is visually distinct from the surrounding text. Activating the icon with a pointing device (for example, clicking on it with a mouse pointer) causes the browser software to formulate a request for further information to

-2-

be sent to the "client". This further information may be simply a "page" of text data, or it may be graphical data, or sound or video data. It may reside on the same server computer as the page containing the hypertext link, but
5 need not do so, and will often reside on a computer many thousands of miles away.

The World Wide Web has recently attracted increasing attention as an advertising medium for various goods and services. The advantage of the Web as an advertising
10 medium is that a single connection allows access by millions of potential customers around the world, without any need for the customers to know or be interested in the physical location of the server computer which is providing the information. Links to the pages of interest may be
15 provided by hundreds or thousands of other pages, provided on other servers, throughout the world.

For many goods and services, the lack of a physical "place" on the Internet is an advantage. A consumer, no matter where his location, is presented with a familiar
20 interface, which makes access very straightforward. The very size of the World Wide Web however, means that, as presently constituted, it is not well suited to answering questions about places and proximity. For example, it is not possible, using existing Web search tools to answer
25 questions such as "where is the nearest hamburger restaurant?" in spite of the enormous benefit which would accrue to major restaurant chains and the like in providing their own answers to such questions, with the speed and ease for which the Internet is famous.

30 The present invention seeks to address the problem of facilitating access by Internet users, and in particular by users of the World Wide Web, to Internet resources, where the primary differentiator between different places of interest is geographical.

35 According to a first aspect of the present invention, there is provided a method of operating a computer system,

the method comprising the steps of:

storing on a map server computer map data
representative of a map of a geographical area;

5 storing on the map server computer coordinate data
indicative of the spatial coordinates of at least one point
associated with the geographical area represented by the
map, so as to enable correlation of points on the map with
their corresponding geographical location;

10 storing on an information server computer information
data relating to at least one place of interest within the
geographical area, said information data including data
representative of the spatial coordinates of the place of
interest within the area;

15 transmitting a map request to the map server computer
from a client computer, and transmitting from the map
server computer to the client computer in response to the
map request the map data and the coordinate data associated
with the area represented by the map;

20 utilising the map data to display an image of the map
on a visual display unit associated with the client
computer;

transmitting an information request to the information
server computer from the client computer, and transmitting
from the information server computer to the client computer
25 in response to the information request the information data
relating to at least one place of interest within the
geographical area; and,

displaying the information data relating to at least
one place of interest on the visual display unit.

30 The map request may be transmitted before the
information request, the information request being
formulated by including coordinate data provided by the map
server.

35 The information request may be transmitted before the
map request, the map request being formulated by including
coordinate data provided by the information server.

-4-

According to a second aspect of the present invention, there is provided a computer system, the computer system comprising:

5 a map server computer for storing map data representative of a map of a geographical area and coordinate data representative of the spatial coordinates of at least one point lying within the area represented by the map;

10 an information server computer for storing information data representative of at least one place of interest within the geographical area, said data including data representative of the spatial coordinates of the place of interest within the area; and,

15 a client computer, the client computer having a visual display unit;

wherein the client computer includes

means for transmitting a map request to the map server computer to request transfer to the client computer of the map data and the coordinate data associated with the area represented by the map,

20 means for displaying an image of the map on the visual display unit, and

25 means for transmitting an information request to the information server computer to identify places of interest known to it and lying within the geographical area,

30 wherein the information server computer includes means for transmitting to the client computer in response to the information request the data representative of at least one place of interest within the geographical area, and

wherein the client computer includes means for displaying said data associated with the place of interest on the visual display unit.

35 The order in which the map server and information server are mentioned above is not meant to imply any particular restriction as to the order in which the servers

are accessed by the client. As with any Web search, either server could be accessed first. A link provided initially by the information server may link directly to a map server in accordance with the invention, for example.

5 In a preferred embodiment, a client device which has the capabilities of both a cellular telephone and a Web browser may pass the names and/or geographical coordinates of its surrounding cellular base stations to the map and/or overlay server computers. Such location information may be
10 utilised by the map server computer to deliver a map of the current location of the client device, and/or by the overlay server computer to identify facilities near to the current location of the client device.

 The information relating to the place of interest may
15 be superimposed or overlaid on the map image at a position on the image corresponding to the location of the place of interest on the map. Thus, for example, the information (or "overlay") server may contain details of, for example, hotels, restaurants, shops or the like, associated with the
20 geographical coordinates of each location. The map server contains map data, including coordinate data representing the spatial coordinates of at least one point on the area represented by the map. Further data is also required, so as to enable correlation of points on the map with their
25 corresponding geographical location. Such further data may be, for example, the coordinates of an additional point on the map. Preferably, the map's scale and overall dimensions are included. Alternatively, coordinates of two opposite corners of the map are included. As a further
30 alternative, the said further data may include a simple scale factor and a direction factor.

 In a further preferred embodiment, the map server may be provided with a list of categories of places of
interest, together with details of the respective
35 information servers on which further information about each category is located. Each of these categories may be

associated with a respective icon on the VDU of the client. In an alternative embodiment, such a list of categories may be provided on a further server.

5 In an embodiment, initially, the client computer may display the map as a simple outline, with no superimposed icons. When one of the "category" icons is activated (for example, by clicking with a mouse or other pointing device), the client computer formulates a request to the appropriate information server for the information server
10 to supply a list of locations known to it which lie within the rectangle defined by the said coordinates. The information supplied by the information server may include textual, graphical, sound, video or other information, and may include additional hypertext links to other locations
15 or facilities on the Web, which themselves may include textual, graphical, sound, video or other information.

It is a particular advantage of the system that the various information servers do not need to have knowledge of the map server software provided on the map server, and vice versa. All that is required in order for the relevant
20 data to be supplied to the client computer is a consistent protocol for providing the coordinates of the various places of interest.

Two or more information servers can provide "places of interest" data independently, without either having any
25 knowledge of the other. For example, one server may provide locations of hotels, a second may provide locations of restaurants, and a third may provide locations of print shops or the like. All of the data (for example, hypertext links, icons etc.) can be overlaid on a single map on the
30 screen of the client computer with hypertext links provided to the various source data on the different overlay or information server computers.

In a particularly preferred embodiment, the client
35 computer may include locating means for establishing the current geographical location of the client computer. This

may be by means of a satellite system such as the Global Positioning System. The client computer preferably includes means for passing the said location information to the information server computer. Such location information
5 may be utilised by the information server computer to identify facilities within a given radius of the current geographical location of the client computer. This facility makes the method of the invention of particular usefulness to portable computer systems.

10 The client computer may include means for scrolling or zooming the map image, to display an image of a different geographical area, and means for varying the displayed data relating to the places of interest, so as to take account of the change in the display geographical area. This may
15 take the form simply of changing the position of the icon or hypertext data relating to particular points of interest, so as to take account of the change in the display geographical area. Preferably, however, the client computer may include means for formulating a further
20 request to an information server, to identify places of interest lying within the new geographical area.

An embodiment of the present invention will now be described by way of example with reference to the accompanying drawings, in which:

25 Figure 1 is a graphical representation of a client screen, showing a simple map with "category" icons;

Figure 2 shows the same map after retrieval of information relating to various places of interest (in this case, hotels and restaurants); and,

30 Figure 3 is a schematic representation of information flow between the map and overlay servers and the client computer.

Referring to Figure 1, the screen 1 of a client computer 10 is shown, as generated by an HTML document.
35 The screen 1 contains three windows or frames: a "map" frame 2, a "navigation" frame 3 containing buttons 4 for

zooming and panning the map, and an "info" frame 5 which controls the display of overlay information on the map.

The overall information flow is indicated graphically in Figure 3. A map request to a map server computer 11 from the client computer 10 specifies the geographical coordinates of the map, which may be the bottom left corner of the map and the top right corner of the map or centre point and scale, for example. The coordinates may be supplied to the map server 11 as the latitude and longitude in degrees of the centre point of the map and its scale, for example.

The map is supplied by the map server 11 in a map response in any of the various conventional graphics formats, for example in "GIF" or "JPEG" format. In a preferred embodiment, the map server 11 will also return the coordinates covered by the map, but this is not essential as they may be inferred from the map request.

Also supplied by the map server 11 are the icons 6,7,8,9, which are displayed within the "info" frame 5. Icon 6 indicates banks, icon 7 restaurants, icon 8 hotels, etc. Information relating to each category of facilities (banks, restaurants, hotels, etc.) is held on an information server computer 12. The information server computers 12 for the different information categories may be the same or different.

Clicking with the mouse on a respective icon 6-9 causes the client computer 10 to formulate an information request, which may be in the form of a standard Web URL (Uniform Resource Locator) including additional protocol elements relating to the location which the user wishes to search.

An important feature of the present invention is the addition of a universally recognised standard for geographic reference (i.e. longitude and latitude) to the protocols and standards of the Internet and the World Wide Web, and its use to combine data from mutually independent

sources.

Information requests produced by the client computer 10 may be of various forms, provided that a protocol is provided for the exchange of the geographical coordinate data.

Figure 3 shows the two key transaction types used by the client 10. One transaction type consists of the information request, which goes to a provider of information to be overlaid on a map, such as an information server computer 12, followed by a response from that provider 12. The other transaction type is a map request, which goes to a map server computer 11, followed by a map response back to the client 10.

Both request types take the form of Uniform Resource Locators (URLs) which are transmitted in the same way as any other WWW request. Unlike other URLs, the map and information requests contain longitude and latitude information which specify the request's geographical coverage.

In a preferred embodiment, the responses also contain longitude and latitude information, but this is not essential as they may be inferred from the requests.

In a simple embodiment, the information response from the overlay or information server 12 consists of an HTML document. This document contains HTML tags specifying one or more overlay icons and their screen positions. It also specifies the map to be displayed underneath the icons.

In a more advanced embodiment, suitable for client browsers capable of running Java or some other local processing capability, the response from the information server 12 specifies one or more overlay icons and associates a longitude and latitude with each. Longitude and latitude are resolved to screen position by a Java Applet or other locally executed program.

The most important difference between the simple embodiment and the advanced embodiment mentioned above is

-10-

the point at which the longitude and latitude of overlay icons are resolved to positions on the screen 1 of the client 10. Advanced embodiments place this function within the client browser, where a Java Applet or some other local processing carries out the transformation. In simple
5 embodiments, the transformation is carried out in the information server. Simpler embodiments are therefore less powerful and have less platform-independence, but can be implemented on simple client browsers.

10 The "map request" shown in Figure 3 may take the following form:

```
http://www.multimap.com?lon="-0.1666"  
      &lat="51.545"&scale="25000"&xp="500"&yp="300"
```

15 This map request contains parameters specifying the longitude, latitude and scale of the map, and also its dimensions in horizontal and vertical pixels (xp and yp).

An "information request" may be of the form:

```
http://mcdonalds.com/locations.cgi?lat="51.5449"  
      &lon="-0.16658"&radius="1.6"
```

20 This is a search request to a server called mcdonalds.com requesting all locations within a one mile radius of a location in Hampstead, London.

The map requests and information requests may contain any number of elements from an expandable list of parameters, including the following examples:

30 lat=51.5449 Latitude in degrees, as a single real number
 lon=-0.16658 Longitude in degrees, as a single real
 number
 radius=1.6 Radius in kilometres
35 max=10 Maximum number of locations in search result
 xp=500 Horizontal size of the map in pixels

```

lon=-0.16658    Longitude in degrees, as a single real
                  number
radius=1.6       Radius in kilometres
max=10           Maximum number of locations in search result
5 xp=500         Horizontal size of the map in pixels
yp=300           Vertical size of the map in pixels
scale=25000      Map scale
vr=0             Virtual Reality level - 0 for "reality",
                  other values specify other "virtual worlds"
10              for testing, simulation or whatever

```

There are a number of other possible terms that may be included.

In simpler embodiments, the map response is an image file encoded in either GIF or JPEG format, for example. It is sent in the same format as other image files on the Web. In more advanced embodiments, the map response may be take the form of either a raster image or vector data, and may be rendered at the client by a Java Applet or other local processing.

The information response can take one of a number of different forms, depending on the capabilities of the client browser.

25 In a preferred implementation, the information response takes the form of an HTML document which contains references to one or more overlay icons, each with an associated longitude and latitude, together with a call to a Java Applet or some other form of local processing.

30 In a simpler implementation, the HTML document may
contain the screen positions of the icons as pixel offsets
rather than longitude and latitude. In this case the
positioning of overlay icons on maps is achieved through
the positioning capabilities of other HTML functions such
as background images, frames, horizontal and vertical image
35 offsets and others.

An example of such an information response is:

-12-

```
<HTML> <BODY background="http://multimap.com?  
lon=-0.1666&lat=51.545&scale=25000&xp=500&yp=300">  
<imgsrc="icon.gif" hspace=240 vspace=140> </BODY></HTML>.
```

In this example, a map is requested from the map server
5 "multimap.com" and is displayed as a background image, and
the icon in the file "icon.gif" is overlaid at the centre
of the map. Preferably, in order to work correctly, this
"map as background" technique should be implemented within
a fixed-size frame.

10 When the user clicks on one of the subject buttons
6-9, the client 10 establishes a connection to the
information server whose URL is embedded in the button 6-9.
The client 10 sends an information request, as described
above.

15 The information server 12 generates a list of the
entries in its database having a longitude and latitude
within the bounds specified, and uses them to create an
information response, as described above. Each entry is
associated with a displayable name and/or icon and
20 optionally a longitude and latitude. The icons or text may
be highlighted to show further information such as levels
of availability, etc.

The client software normally overlays the displayable
names and/or icons on its map.

25 The user has the option of opening one or more icons
from the screen, normally by clicking on the displayable
name. This passes the URL to the Web browser which opens
it in the usual manner.

30 In Figure 2, the current location has been sent to
three servers: one run by a high street bank, which
returns the location of cashpoint machines, one by an
independent hotel reservation system and one by a well-
known fast food chain.

35 The result of the responses by the overlay servers 12
are shown in Figure 2, in which the same map is displayed
with icons 13 representing the various facilities reported

-13-

by the second server 12, and hypertext links 14 to text pages or other Web facilities, in the usual way.

It should be noted that the client computer 10 may be used to transmit the information request with geographical data first. The overlay or information server 12 responds with information data, including coordinate data, relating to the requested services for example. This data, as well as being used to generate the display on the client computer 10, can be used to formulate the map request including coordinate data for transmission by the client computer 10 to the map server 11. The map server 11 then responds with the map data, which is then transmitted to the client computer 10. The map can then be displayed on the client computer visual display unit and overlaid with graphics representing the information data. In other words, either the map request or the information request can be formulated first for transmission to the appropriate server 11,12.

The architecture of the preferred system is such that it can support a movable map window. A user can scroll North, South, East or West on the screen and see more detail appear, and can zoom in and out for more detail or for a wider perspective using the zoom and move buttons 4. This also enables a moving display, such as a hand-held device or a rolling map installed in a car, to be dynamically updated with new locations as the displayable window moves over them.

Although the client computer 10 may be a stationary PC connected to the Internet, the architecture is designed to support mobile clients such as car navigation systems and personal digital assistants (PDAs). The client software preferably supports direct connection to Global Positioning System (GPS) receivers, and preferably implements the NMEA 0183 standard for exchange of navigational data. If the client is also a cellular telephone, it preferably supports the transfer of information derived from the cellular

-14-

network. In a preferred embodiment, the client transfers its own position to the information server and map server within the HTTP protocol by adding an HTTP header line to its request messages. In the case that the client is
5 connected to a GPS receiver and therefore knows its exact location, it can add an HTTP header line as follows:
remote_position: lon="-0.1666"; lat="51.545". In the case that the client does not have its exact position, but does have access to the name of its nearest cellular base
10 station, it can add an HTTP header line as follows:
remote_cellname: LONDON-SW-5. A map server or information server which maintains data on the locations of cellular base stations can convert the cell name to a location and deliver the appropriate map and/or overlay information. In
15 the case that the client is not able to add HTTP header lines as described above, location and/or cell names may be transmitted within other HTTP headers or within the HTML protocol, but such embodiments are not considered preferable. It is important to note that the client will
20 often request information on a location other than its own current location, and that the location of interest is transferred within the Map Request/Information Request URLs, while the client's own location is transferred in the HTTP header. This combination allows the server computers
25 to implement a wide range of additional functions, such as displaying the distance from the current location to the location of interest. In the case that the client's location is known to be changing, such as a cellular phone connected to a GPS receiver, the screen display may be
30 refreshed on a regular basis to show the client's current location. This refresh may be achieved by using the "refresh" function within the HTTP/HTML protocols, or it may be achieved using the local programmability of the client.

35 It is particularly preferred that the additional functionality provided within the World Wide Web, and its

-15-

architecture, is built within the extensible framework of HyperText Markup Language (HTML) and the HyperText Transfer Protocol (HTTP). The extensions to HTML/HTTP are thus preferably entirely compatible with existing Web standards and do not seek to modify or replace any part of the Web architecture.

In a preferred embodiment, the functionality described above is added to the client computer 10 by providing additional software for a known Web browser (for example, Netscape, Mosaic, etc.). This software may be implemented as separate programs (i.e. a "helper application"), or as plug-in programs that execute within a browser program, or as Java Applets which are downloaded and executed as required.

Alternatively, a subset of the full functionality may be implemented using the browser's standard display and positioning capabilities only. An implementation of the latter case requires greater functionality in the information server, and is a preferred implementation in circumstances where it is difficult or impossible to add functionality to the client browser.

The server computers 11,12 may employ well-known standard database tools in conjunction with known Web server packages, in order to recognise the requests and generate the responses described above.

Another important feature of the present invention is that maps and overlay information can be "persistent". That is, pointers to maps or places can be stored in databases on the client computer 10 and become a permanent feature of displays. A typical use of this feature would be to store the user's home location and display it on any map covering that location.

In a preferred embodiment, persistent locations are stored using the extensions to HTTP known as "magic cookies". The magic cookie parameters used are based upon the request parameters listed above, i.e.:

-16-

Set-Cookie: Home="lon=-0.1666&lat=51.545";

Software may be provided for the conversion of postal codes (zip codes) into longitude and latitude information. Software may be provided for the conversion of full or partial addresses into longitude and latitude information. This software is normally provided on the map server 11; in this case, the user enters an address or postcode in a form and sends this to the map server. The map server responds with an HTML document containing longitude and latitude, and the user receives a map of the locality of the address or postcode. Alternatively, such software can be provided on the client computer 10.

The system and method of the present invention avoids the classic problems of Geographic Information Systems (GISs) by imposing a single, standardised geographic reference model, and restricting data exchanges to those classes of geographic information which can conform to the reference model.

Because of this, servers providing information do not have to deal with maps, map ownership issues or mapping software, and information from several different sources can be integrated on a single screen.

It is of course envisaged that the invention may be implemented in ways which are different from the ways specifically exemplified above. For example, the coordinate data embodied in the map and facility information may be presented in ways other than in absolute latitude and longitude format.

Embodiments of the present invention have been described with particular reference to the examples illustrated. However, it will be appreciated that variations and modifications may be made to the examples described within the scope of the present invention.

-17-

CLAIMS

1. A method of operating a computer system, the method comprising the steps of:

5 storing on a map server computer (11) map data representative of a map of a geographical area;

storing on the map server computer (11) coordinate data indicative of the spatial coordinates of at least one point associated with the geographical area represented by the map, so as to enable correlation of points on the map with their corresponding geographical location;

10 storing on an information server computer (12) information data relating to at least one place of interest within the geographical area, said information data including data representative of the spatial coordinates of the place of interest within the area;

transmitting a map request to the map server computer (11) from a client computer (10), and transmitting from the map server computer (11) to the client computer (10) in response to the map request the map data and the coordinate data associated with the area represented by the map;

20 utilising the map data to display an image of the map on a visual display unit (1) associated with the client computer (10);

25 transmitting an information request to the information server computer (12) from the client computer (10), and transmitting from the information server computer (12) to the client computer (10) in response to the information request the information data relating to at least one place of interest within the geographical area; and,

30 displaying the information data relating to at least one place of interest on the visual display unit (1).

2. A method according to claim 1, wherein the map request is transmitted before the information request, the

35

-18-

information request being formulated by including coordinate data provided by the map server (11).

3. A method according to claim 1, wherein the information request is transmitted before the map request, the map request being formulated by including coordinate data provided by the information server (12).

4. A method according to any of claims 1 to 3, including the step of superimposing information relating to the place of interest on the image on the visual display unit, at a position on the image corresponding to the location of the place of interest on the map.

5. A method according to claim 4, wherein the information superimposed on the image is a hypertext link.

6. A method according to claim 4 or claim 5, wherein the client computer (10) includes means for scrolling the map image to display an image of a different geographical area, and means for varying the displayed data relating to the at least one place of interest on the visual display unit (1) so as to take account of the change in the displayed geographical area.

7. A method according to claim 6, wherein the varying of the displayed data includes the step of shifting the position of the superimposed information in response to scrolling of the map image.

8. A method according to claim 7, wherein the client computer (10) includes means for formulating a further request to the information server (12) to identify places of interest lying within the different geographical area.

9. A method according to any of the preceding claims, wherein the client computer (10) includes means for zooming the map image in or out to display an image of, respectively, a smaller or larger geographical area, and
5 means for varying the displayed data relating to the at least one place of interest on the visual display unit so as to take account of the smaller or larger geographical area.

10 10. A method according to claim 9, wherein the client computer (10) includes means for formulating a further request to the information server (12), to identify places of interest lying within the smaller or larger geographical
15 area.

11. A method according to any of the preceding claims, including the steps of:
storing on the map server computer (11) a list of categories of places of interest;
20 retrieving the list with the map data; and,
displaying on the visual display unit (1) a respective icon (6,7,8,9) for each said category.

12. A method according to any of the preceding claims, wherein the request is effected by activation of a
25 respective icon on the visual display unit (1).

13. A method according to any of the preceding claims, wherein the client computer (10) includes locating means
30 for establishing the current geographical location of the client computer (10), and including the step of passing the current geographical location of the client computer (10) to at least one of the map server computer (11) and the information server computer (12).
35

14. A method according to claim 13, wherein the locating means uses the Global Positioning System.

5 15. A method according to claim 13, wherein the locating means includes a cellular telephone.

10 16. A method according to any of claims 13 to 15, wherein the client computer (10) includes means for superimposing on the image an icon indicative of the current geographical location.

17. A computer system, the computer system comprising:

15 a map server computer (11) for storing map data representative of a map of a geographical area and coordinate data representative of the spatial coordinates of at least one point lying within the area represented by the map;

20 an information server computer (12) for storing information data representative of at least one place of interest within the geographical area, said data including data representative of the spatial coordinates of the place of interest within the area; and,

a client computer (10), the client computer (10) having a visual display unit (1);

25 wherein the client computer (10) includes means for transmitting a map request to the map server computer (11) to request transfer to the client computer (10) of the map data and the coordinate data associated with the area represented by the map,

30 means for displaying an image of the map on the visual display unit (1), and

35 means for transmitting an information request to the information server computer (12) to identify places of interest known to it and lying within the geographical area,

-21-

wherein the information server computer (12) includes means for transmitting to the client computer (10) in response to the information request the data representative of at least one place of interest within the geographical area, and

wherein the client computer (10) includes means for displaying said data associated with the place of interest on the visual display unit (1).

18. A computer system according to claim 17, wherein the client computer (10) includes means for formulating the information request by including coordinate data provided by the map server (11).

19. A computer system according to claim 17, wherein the client computer (10) includes means for formulating the map request by including coordinate data provided by the information server (12).

20. A computer system according to any of claims 17 to 19, wherein the client computer (10) includes means for superimposing information relating to the place of interest on the image on the visual display unit (1), at a position on the image corresponding to the location of the place of interest on the map.

21. A computer system according to claim 20, wherein the information superimposed on the image is a hypertext link.

22. A computer system according to claim 20 or claim 21, wherein the client computer (10) includes means for scrolling the map image to display an image of a different geographical area, and means for varying the displayed data relating to the at least one place of interest on the visual display unit so as to take account of the change in the displayed geographical area.

-22-

23. A computer system according to claim 22, wherein the client computer (10) includes means for varying the information from the information server computer (12) which is displayed, in response to scrolling of the map image.

5

24. A computer system according to claim 23, wherein the client computer (10) includes means for formulating a further request to the information server computer (12), to identify places of interest lying within the different geographical area.

10

25. A computer system according to any of claims 17 to 24, wherein the client computer (10) includes means for zooming the map image in or out to display an image of, respectively, a smaller or larger geographical area, and means for varying the displayed data relating to the at least one place of interest on the visual display unit so as to take account of the smaller or larger geographical area.

15

20

26. A computer system according to claim 25, wherein the client computer (10) includes means for formulating a further request to the information server computer (12), to identify places of interest lying within the smaller or larger geographical area.

25

27. A computer system according to any of claims 17 to 26, wherein the client computer (10) includes locating means for establishing the current geographical location of the client computer (10) and means for passing the current geographical location of the client computer (10) to at least one of the map server computer (11) and the information server computer (12).

30

28. A computer system, substantially as described with reference to the accompanying drawings.

35

-23-

29. A method of operating a computer system, substantially as described with reference to the accompanying drawings.
